$$\mathcal{E} = \Sigma Q.$$

$$\mathcal{E}_{tr}^{n} = (R_{in})_u - (R_{out})_u^{nonr} - (R_{out})^{r} + \Sigma Q$$

$$\bar{\mathcal{E}} = (R_{in})_u + (R_{in})_c - (R_{out})_u - (R_{out})_c + \Sigma Q.$$

$$= (R_{in})_u - (R_{out})_u + \Sigma Q.$$

二者相等有:

$$(R_{out})^{nonr} + (R_{out})^{r} = (R_{out})_u$$

$$\Rightarrow \quad \mathcal{E}_{tr}^{n} = \bar{\mathcal{E}} \quad \Rightarrow \quad k_c = 0$$

Case 1

$$(R_{out})_u(CEP) = (R_{out})^{r} + (R_{out})^{nonr}$$

	↓	↓	↓
①	$h\nu_2$	$h\nu_1$	0
②	0	$h\nu_1$	0

靠近源，CEP 失效？
